ABSTRACT

Digital technology has a relatively unseen effect on the way education is experienced in the day-to-day engagement with the education continuum. Students' learning, communication, and information sharing habits have shifted with digital technology. Education is more accessible and flexible with online lectures, learning platforms, discussion forums, and the use of artificial intelligence (AI) tools. But they've also raised questions regarding plagiarism, misinformation, cyberbullying, privacy, and responsible use of AI. This paper investigates the ethical issues and civic engagement of digital learning and its implications for students. It is based on the educational theories of John Dewey, Albert Bandura and Lawrence Kohlberg and suggests the framework of Ethical Digital Citizenship Education (EDCE). The three pillars of the framework are Ethical Awareness, Responsible Participation and Reflective Judgement. These pillars are aimed at identifying ethical issues, relating ethically with others and considering carefully before taking action online. The paper states that the mere use of technology does not guarantee that a student is familiar with how he or she can use technology responsibly. It thus recommends the incorporation of ethical decision making and responsible digital behaviour in educational methods and policies. The proposed framework is a conceptual study and hence has not been tested in practice. There is a need for further studies to explore its use and impact in various educational contexts.

Keywords: Digital Learning, Ethical Awareness, Civic Responsibility, Digital Citizenship, Artificial Intelligence (AI), AI Ethics, Data Privacy, EDCE Framework.

INTRODUCTION

Background of the Study

In fact, the use of educational technology has progressed rapidly such that it is difficult to recall the past 10 years. dated. The new accessible Artificial Intelligence tools are an added layer students. Students' learning, communication, and information sharing have been greatly transformed by digital technology. The use of online lectures, learning management systems, discussion forums, messaging apps, and artificial intelligence (AI) tools are prevalent in contemporary learning. These technologies have enabled learning to be more flexible and accessible, allowing students to gain access to learning resources outside the classroom.

But digital platforms have also presented ethical issues in the classroom. Students may come across with misinformation, cyberbullying, privacy issues, plagiarism, and queries regarding the responsible use of AI generated content. Digital tools offer opportunities to learn and collaborate, but don't guarantee students know how to do so ethically. Traditional classrooms have the ability to control the discussion, promote respectful behaviour and educate students on the implications of their actions. This can be more difficult in a digital environment where interactions can take place without direct supervision. Students can pass on information

without confirming its validity; can plagiarize others' work; can communicate in ways that are detrimental to others.

The advances point to the significance of embedding ethical awareness and civic responsibility into digital education. It's important that students not only have the technical skills but also be able to critically assess information, respect the rights of others, protect privacy and think about the implications of what they do online. As a result, digital learning needs to not only help students with academic growth, but also in their responsible involvement in digital communities. This study explores these concerns and introduces the Ethical Digital Citizenship Education (EDCE) framework as a conceptual approach to promoting ethical awareness and civic responsibility among students. For research, and potentially that these systems might not be optimal for this. Instruction in judgment or in character.

This infrastructure was handed over to the educational institutions. Not only was it not designed but it's now up to them to teach ethics within spaces that weren't. Designed to aid the teaching. This difference in how the platforms students are using and the values that institutions hope that students will use. Hold is one of the more muted factors contributing to the problems outlined below in this paper.

A classroom can It can be moderated to any level to set its norms; a public comment section or a group chat is not was managed in a controlled fashion, like the other. This separation is useful to any initial discussion of this topic. institution interested in developing digital learning but not simply ‘copy and paste’. Any tool whatsoever, that is easiest to use.

Problem Statement

The ability to be comfortable with technology and the ability to use it ethically are two different abilities, In the current educational context the assumption that the first is a guarantee of the second is made. It does not. Misinformation spreads not because students don't have the ability to do it technically, but because it is quicker to share than checking, and platforms are designed to be fast, and not accurate.

A violation of academic honesty, harassment and violation of privacy will be considered a conflict The social and cultural commitment involved in implementing the necessary tool set to prevent the negative act is more challenging. If there are no signs, they typically are on the door or in the room, then the student can continue with the behaviour. Two names that are usually omitted from the web are victim and an accountable name.

With the help of Artificial Intelligence, this becomes even more complicated. If a student turns in AI written work as... Now, with their own work, the question is no longer "did you copy someone else's work" but rather "did you stole it. The moral issue is “did you copy someone else's work?” not “did you stole it?” What is authorship anyway if there is a “genre” that isn't as solid as a traditional one? passable essay in seconds? Their impact will gradually diminish and they can be overused, all the skills, original argument, independent analysis, the discomfort of a blank page that Education should foster. Another, not as widely known is the amount of engagement that children demonstrate in digital modes.

Skill development and employment which were more suitable to the country. An engagement that can be made in theory on digital platforms. There are many different types of time spent online. Make online behaviour an automatic translation to responsible and socially useful behaviour.

Without deliberate Familiarity with the platforms and learning the rewards that are included in using them attention, The motivation to be Viral to go viral, not incentives based on ethical or civic value. There's a more understated, architectural version of this issue, too, which persists in many institutions they measure.

The most effective way to do digital learning is almost always through the fingertips (technical) and/or academic lens (academic). In fact, none of these are indicative of the actual content of your course as is the case with assignment completion rates, quiz scores, platform logins, etc.

A student is allowed to submit Turn in all assignments by the deadline and earn top grades on all quizzes and frequently plagiarize classmates' work. Criticise others in a closed group message or gossip about others.

Because These are not seen in metrics that are normally used in a business or institution, but can persist for a considerable period before anyone realizes something is wrong for years, without the correction.

Research Questions

1. What is the impact of digital learning on pupils' ethical awareness?
2. How might digital learning foster civic responsibility & respectful online behaviour?
3. What are some of the ethical issues that emerge in the context of using Artificial Intelligence in education?
4. What can be done to enhance the Ethical Digital Citizenship Education (EDCE) framework? Digital learning environments?
5. What can be done in education to provide students with safe and responsible use of?

Together, these questions will carry the conversation beyond a single focus on academic results. and then on to a larger issue what type of digital citizen is education actually creating, What do you hope to create and what type?

Purpose and Significance

The aim of this paper is to explore the impact of digital learning on students' moral thinking, Responsibility, sense of responsibility towards others and behaviour. Academic achievement and technical Although essential, these measures of student proficiency are no longer enough. A student who knows how to create an application but is not aware of when they're misinforming, or who can write perfect code but doesn't think there's anything wrong with copying a classmate's work. because "everyone does it," represents an incomplete education.

The EDCE framework, which combines digital literacy, 21st century skills, and the community and the environment, is the paper's major contribution. Ethical reasoning and civic awareness as separate teachable, rather than as one. As optional, sometimes talked about extensions to the technology course. The framework is intended to be utilized a reference point that institutions can customize in their course design and orientation. material, or policy not just an abstract reason.

Equally as important, this research timing. Current decision making by Institutions discuss AI use policies, discuss how much of a course should go online, discuss if to incorporate digital citizenship units at all under significant uncertainty, often without a has a clear conceptual starting point with which to work from. A fairly well-organized structure, even a theoretical one, can provide more solid ground for such decisions than rules made on an ad hoc basis in reaction to the. Next most recent incident of misconduct. In this regard, this paper targets policy.

Scope and Limitations

This paper will be a conceptual and a theoretical one. It is NOT survey based, interview based or statistical based, but instead it is based on published literature, an established theory of education, and on reasoned argument. Focuses on a particular area of interest misinformation, cyberbullying, privacy, and ethical uses of AI. Civic involvement within digital contexts as they apply to students within the formal education school system.

The obvious limitation of a theoretical approach is that it fails to prove that EDCE really impacts on students' behaviour when it is implemented, and that it can predict ethical issues created by technologies that have yet to come to life in particular, AI systems are evolving so rapidly that what is written here may need to be revisited in a few years.

These restrictions are not assumed, but recognised and stated, and provide an explanation for the empirical follow up work proposed at the end of this paper.

LITERATURE REVIEW

Evolution of Digital Citizenship from Safety to Agency

It was not about ethics, it was about safety, that's what digital citizenship was about. The fundamental digital literacy curriculum included a lot of "don't" messages Don't tell anybody your password; Don't talk to people you don't know online; Don't download anything you don't know about. The Ninth elements of Digital Citizenship is a concise summary (in the context of Internet research ethics) beyond safety and focus on digital etiquette, digital law, digital communication, as Ribble notes, "The Nine Elements of Digital Citizenship! Safety and security (Internet Research Ethics Digital Citizenship Education), as well as rights and responsibilities (Internet Research Ethics Digital Citizenship Education).

Students aren't 'consumers,' they're 'creators and amplifiers' and that's important when it comes to that expansion. As soon as a student gets to school, with a smart phone, he/she can write for thousands of readers and while a teacher is counting the roll. While teaching about digital citizenship in the classroom is one goal, Ribble says, he has more ambitious goals, such as preparing students to live in a society that is saturated with technology.

It's so ubiquitous that it feels like common sense so much so that it has been the focus of more recent research in order to arrive at a workable definition of digital citizenship and of digital citizenship education. Education researchers carried out a three part Delphi study to propose a framework for the learning and teaching of digital citizenship, broken down into affective, behaviour and cognitive (Defining digital citizenship and digital citizenship education a Delphi study, Taylor & Francis, 2025), meaning, awareness of the emotional and ethical dimensions of digital life, participation in digital community in an inclusive, ethical way, and critical evaluation of content, bias and risk. The affective behavioural cognitive structure is similar to the three pillar EDCE model which will be introduced later in this paper, and offers independent support from a different perspective.

It is important to reflect on the reasons for the timing of this, as opposed to earlier. This is a shift away from the "safety first" paradigm of digital citizenship in general toward a more comprehensive, agency oriented view of digital citizenship, similar to the shift in students' online behaviours. A decade and a half ago the student experience of the Web was reading, surfing and in a few cases, sending and receiving e mail. The student today is far more likely to be a publisher, a poster, a commenter, a streamer and even more and more of the times a teacher of an AI system that he or she is responsible for. A framework which is only a concept of staying safe, has little to say about the ethic of publishing, remixing or content creation where an agency-based conception of digital citizenship has been seeking to fill the void.

Evolution of Digital Citizenship from Safety to Agency

Three lines of thinking, two of which are extremely ancient in the realm of educational theory. Of those, one is moral psychology, with which ethics in digital learning will be based in this paper.

In fact, said John Dewey many years before the advent of any modern technology such as the internet, morality development is not a subject for lecture. An experience judgment, from the community, and NOT a set of rules learned about judgment. With electronic learning, Dewey's insights are that they are not able to teach ethics in a course or module in the syllabus; they must be experienced in the life of the community, projects and forums in which learners are already engaged. It's a class on respectful online communication but not taught if it doesn't provide students with a real opportunity to engage in an online discussion and learn how to do it in a respectful way. The missing mechanism is offered by Albert Bandura's Social Learning theory which states that students learn behaviours primarily through observation, particularly from others that they like or would like to be like. The opportunities for modelling are vast and unchecked on the internet, and now influencers, classmates, the anonymous commentator, and algorithms are all competing for a foot on the door the chances are that even more will be given a boost. If the loudest, the most prominent examples elicit outrage then, according to the theory of Bandura, so do students learn not what it is claimed in the syllabus that they are supposed to learn, but rather that which elicits their outrage. Practically, what is important is to recognize that ethical digital education requires to promote good behaviour rather than simply stating it, as it should become a common way of doing things and a good habit, such as “empathy, careful sourcing and constructive disagreement”.

The third useful lens is one that was developed by Lawrence Kohlberg who studied the stages of moral development, demonstrating that moral thinking passes from fear of punishment, to conforming to social norms and to what is expected by others. Eventually towards reasoning based on self settled ethical principles which will apply even in the absence of any observer and none that are likely to be punished. The two traits referenced in the accounts of the lower stages of Kohlberg's moral development no one is around to be afraid of, and there is not much privacy are the source of much of the wrongdoing that is referred to in this paper. Sometimes, peer encouragement online can be counterproductive and instead be encouraging this negative behaviour. When considered from the point of view of Kohlberg's stages, ethics education in the digital medium is bound with a clear purpose, which, however, is reasonably demanding, and of teaching the learners to reason, not from fear of being caught being caught online is less assured than being caught in a physical classroom. Dewey, Bandura and Kohlberg together propose a fairly specific approach to teaching for example, providing opportunities for students to make actual online decisions and judge their actions (Dewey); and consistently training and reinforcing students in responsible online decision making while reinforcing them in the opposite direction irresponsible (Bandura). To deliberately move the ethical thinking from external regulation to internalised rule (Kohlberg), as this external regulation is lacking in digital environments.

Figure 2. Evolution and Theoretical Frameworks of Digital Citizenship

Empirical Signals from Related Research

This paper is theoretical, but it should be noted that it is the argument that is not being made in isolation there are a number of emerging empirical studies that agree. Students involved in a digital citizenship class which was embedded in a Pancasila education program were found to have an increased awareness of ethical issues and better social media use decision making following the class, some of the students said that the class was too theoretical and that they did not have any real life examples to study (The Role of Digital Citizenship Education in Cultivating Ethical Social Media Use, Atlantis Press). That criticism is pertinent and what this means is that an EDCE approach can only be successful when there is a connection with 'on the ground' teaching in scenarios rather than abstract guidelines.

The comparison of the perception of digital citizenship education among students and teachers showed that students' perception of the importance of the digital citizenship education was lower than teachers' perception of the importance of the digital citizenship education, so students might learn that they have a lack of digital ethical judgment if they are faced with a dilemma (Comparison of Students' and Teachers' Opinions Toward Digital Citizenship Education, PMC/NCBI). This incongruity between what students think they know about ethics and what they actually know provides justification for incorporating ethical component into digital learning without assuming students already know it.

The study of digital citizenship in the context of augmented reality and the new technology of education revealed that teachers did not have a clear or consistent understanding of the concept of what digital citizenship is, and they were not typically trained in digital citizenship. Where it was taught, it was done in bits and pieces throughout various courses and not as a single topic (Digital Citizenship Education Shaping Digital Ethics in Society 5.0, ResearchGate). Where teachers don't know where to draw the line, it's much less likely that they will be able to provide consistent, confident instruction to students. This finding reiterates one part of the problem posed in this paper. The gap is not just the student's, it is a gap of educator preparedness.

Research Gap

After reading the literature as a whole, three gaps are found. First, most digital citizenship research has treated ethics as a strand separate from digital skills, taught in a separate strand of lessons (or not at all) rather than a strand of digital skills that embeds ethical thinking into the teaching of the digital skills (and AI based skills themselves). Second, while a few studies (including the Pancasila study mentioned above) examine the change in awareness following digital citizenship courses, there is less research conducted to understand how increased awareness relates to continued behaviour change once students return to their natural and unsupervised online environments. Thirdly, most models of digital citizenship are geared toward the internet of social media and search engines, rather than the internet of generative AI, where anyone can type in a few words and then type out their entire completed essay.

This paper takes this first void on the head; proposing the EDCE framework for integration, rather than extraction of ethics from digital participation. It specifically expands the conversation to include ethical issues of AI, the second and third gaps, that it has been identified as under addressed. But this is not enough to answer the second gap (How to achieve long term behaviour change), as this is an empirical issue. Is discussed again in the Suggestions for Future Research section.

The fourth gap to be noted is the gap between the educator and educator preparedness as described in the previous section. There have been few published studies on digital citizenship that involve the teacher teaching and demonstrating digital ethics, instead assessing students for their digital ethics.

When digital citizenship is taught to students and not model by the adults who teach it, there is the potential for digital citizenship to become a 'teachable' issue and not an ongoing model behaviour. The EDCE framework is structured to apply to the design and delivery of a course, and the outcomes that a student can expect to learn from the course.

Three Pillar Framework (EDCE)

In the context of the theoretical basis described above, this paper introduces the idea of the Ethical Digital Citizenship Education (EDCE) framework a three-part interconnected framework.

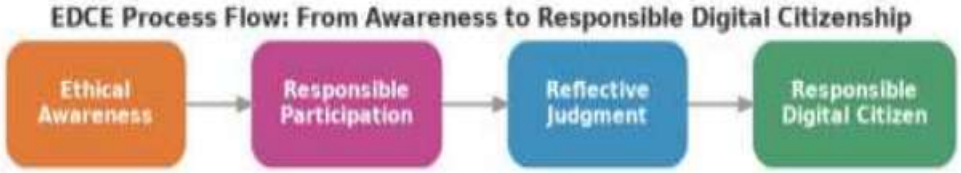

Figure 3. EDCE Process Flow — From Ethical Awareness to Responsible Digital Citizenship

Ethical Awareness

This pillar is "identifying an ethical dilemma" (plagiarism, misappropriation of someone's data, cyberbullying, falsification of data, etc.). Violations of privacy can only be avoided if a student first detects that a situation is a violation of privacy. There is quite a lot of unethical digital use that isn't malicious; it's just people don't realize that there is a line to begin with.

Let's say a normal, common message is forwarded to someone, for instance, a student receives an e mail stating that a popular brand is giving away free merchandise if they forward the message to 10 people. It's free, takes no time, does no harm perhaps even good to pass it along, as it appears to be providing a means to a friend who might have something of value. Ethical Awareness is the moment that would give a student pause and allow them to take note that the claim is almost certainly false, that forwarding the claim helps to perpetuate a broader trend of misinformation. This convenience comes with no guarantee of harmlessness. If it wasn't for this pause, the action just occurs, just like any other tap on a screen.

Responsible Participation

This pillar is about the actions that take place after a student is online sharing opinions that invite conversation rather than stifle it; participating in group and community areas in a positive manner. Whether they view digital platforms as platforms that have real social consequences, or platforms that don't have any consequences.

What counts with this pillar is a student's behaviour in a dispute; agreeing is not a better sign of character. A student has an disagreement with another student about different ideas in a course discussion forum and responds with ideas, not to the student he/she is in disagreement with, but to the ideas he/she is in disagreement with. Views the exchange as an opportunity to further the point, rather than to score points. When there is no habit, the same disagreement is likely to be worse, many of which are seen in an online comment thread to a few posts spiral cut of control.

Reflective Judgment

This is the "stop" before the action to consider a situation, think about more than one opinion and think through a situation to a conclusion before reacting impulsively. It is most similar to the moral reasoning which is practiced as Dewey would have described it, and possibly the most challenging of the three to teach. That's because it challenges the intent behind the swift and responsive design of most digital spaces.

Most digital interfaces are built to remove this lag time altogether there needs to be some indication and there needs to be a response button with only a single tap. It can actually be beneficial to create this missing time in practice, meaning that students write a response, and then attempt to think about it again after a few minutes, or asking students to state that they are going to write argument and then counter argument before posting it. These are small, seemingly mechanical behaviours, but they are counterproductive in design pressures that render reflective judgment problematic.

METHODOLOGY

Study Type

This is a theoretical and conceptual research, where no survey, interview, experiment or statistical data collection takes place. Instead, attempts are made to think through issues concerning digital learning, the ethical issues associated with digital learning, and educational ideas and themes that are applicable to digital learning and then combine them into something useful.

Approach

It is subjective and analytical approach reading the existing academic literature, educational theory, concept and comparing and contrasting the readings to understand how digital citizenship, AI ethics fit into the readings. Participate in civic engagement, communicate with each other, and not think of how to respond.

Data Sources

The paper relies on peer reviewed and academic sources that are related to digital ethics and digital citizenship education. The selection of the sources was not based on their extensive coverage of the field of psychological development of moral concepts and conceptual theories relating technology use to social behaviour, but rather, on whether they were directly relevant to answering the research questions of the paper.

Justification

A theoretical methodology is suitable to a topic involving ideas, values. Its advantage is that, digital technologies and AI systems evolve, very recent developments, including those of an ethical nature related to AI, can be added a longer empirical study may not be able to measure these.

In the argument of which we make no apology, that is a trade-off that has to be taken, for a paper of this kind cannot easily change a framework rather than a claim based on a survey result; a framework that is worthy of an empirical test first is reasonably complete and self-consistent in any case, and the theoretical work supplied here is meant to be the first step, not the last step, in the most important step.

Conceptual Findings

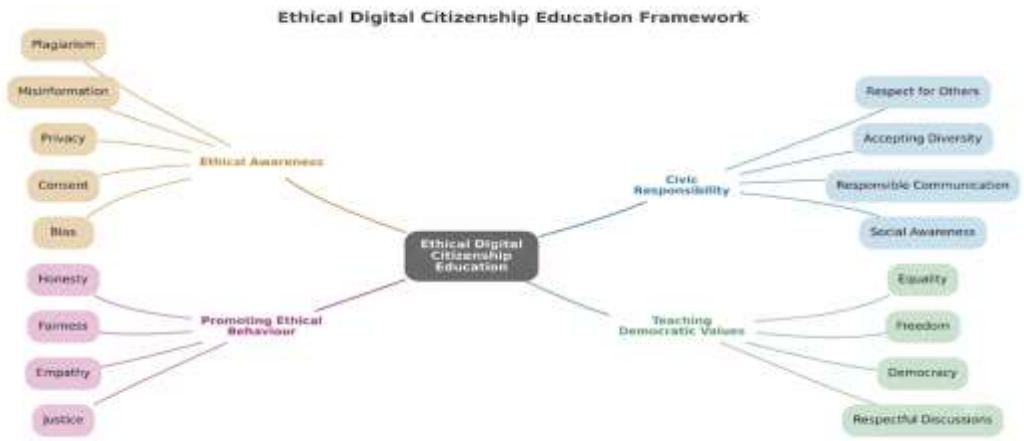

Figure 4. Ethical Digital Citizenship Education (EDCE) Framework — Detailed View

Ethical Awareness Objective

Ethical issues Plagiarism, Misinformation, Privacy, Consent, Bias, Data misuse require to be taught as events that occur to real people in authentic circumstances, not as the mere definitions of terms. To memorize in preparation for a test. A student who can give an appropriate definition of plagiarism and cannot identify When

pressed for time on a deadline, it hasn't learned the lesson after all. Linking these topics To contexts within which pupils might find themselves a group discussion which receives an unverifiable claim, To take a picture of an abstract concept, and share it with another classmate without prompting.

This objective needs to be applicable to AI supported work in particular due to the use of AI. Ambiguity of authorship which is not found in older plagiarism policies. A student who a) makes no particular disclosure when submitting an AI generated paragraph. Copying an essay from another student in class is the same problem as work is two people doing the same thing. Introduced as a more independent than it actually is of the student. Ethical Awareness Training in an AI enriched environment thus requires an answer that is clear and explicit to a question. Many syllabus documents don't discuss acceptable AI assistance and what's not. not instead of giving students a line that is not expressed.

Civic Responsibility Objective

There is a need for respect of others, openness to other perspectives and positive communication. Active support with learning not passive taking for granted. Students with comfort level with using a computer. Where there is conflict that happens rapidly online, there is sometimes a need for explicit modelling of what a constructive conflict is. There is a sense of disagreement before it is met with some attempt to disagree by others. In this, one of his subjects is civic responsibility. Less a value to be preached and more a skill to be practised is sense,

Institutions are also in a good position to provide low stakes practice of civic participation before. In education, they do not really experience its more severe aspects. Moderated class discussion. An online forum in which students are leading and in which the structure is not too institutional, on a real issue in contestation, A project that you have to do with other people and can't agree with them so that they can agree on a goal to achieve. can be a rehearsal area an area in which the ability to disagree well can be honed. with less negative repercussions to a student after he or she has graduated.

Promoting Ethical Behaviour

Honesty, fairness, empathy, cooperation and justice are more viable behaviours in the classroom. Better than on a wall as posters. Worms used for regular classroom activities (group assignments, peer review, collaborative projects these values are not unique, but appear many times in the project. orientation. Doing this safely and respectfully, like many other things, can be best learned by making it a habit, more than an isolated lecture. Peer review is one example of this that is very good. When students must fairly assess a classmate's work, provide honest, but not inappropriate, feedback, and keep feedback to a classmate confidential. They are practicing fairness and reciprocating when others are fair towards them, they are not kind. empathy directly (not through being told about them in the abstract). Teacher facilitation of this peer review process in a digital space students as moderators of their own discussion forum. For example, to agree to practice towards exactly the same environment. Wherever it's the toughest to maintain ethical behaviour.

Teaching Democratic Values

Equality, Freedom of Expression and Democratic participation are easily applicable to digital. Structured debates, moderated forums, etc., constituted by institutions for the purpose of creating spaces. and collaborative approaches rather than conflict avoidance strategies that engage student(s) in conflict. it. In contrast, there's a tendency for digital spaces to be undesigned, and to be echo chambers and fast, low effort reactions.

Unlike a real classroom, a digital classroom forum does not have to adhere to turn taking, In the same time in the air, or the same emotion of who's there a few vocal performers might Interrupt a whole conversation, excluding quieter students. Teaching democratic values In the context of "digital spaces", the term almost always refers to a conscious manipulation of the conditions under which a person is able to learn, but it does not necessarily. structured turn taking in an online discussion, is automatically provided by physical classroom.

anonymous or initial contributions without mention of names, or norms of explicit response. length and tone. This is not something that you might expect to get for free, it has to be designed.

DISCUSSION

It is suggested that the conceptual analysis ought to be seen in a wider perspective, both with regards to educational outcomes (learning outcomes) and the ethical conditions for learning (ethical conditions). Digital technologies can open up opportunities for learning, communicate and collaborate, and help to build new skills. But technology access and skills do not necessarily make for responsible digital behaviour. The proposed EDCE framework takes into account this distinction in three interconnected pillars. Ethical Awareness is about identifying situations involving issues of information reliability, privacy, academic integrity and AI use. Responsible Participation focuses on respectful communication, accountability and constructive engagement with others. Reflective Judgment leads students to look at the evidence, think about other points of view, and assess potential outcomes before making a decision. These pillars offer a conceptual framework to incorporate ethical issues into digital learning experiences.

The framework also suggests the educational design could be of potential importance. Students can learn about appropriate online behaviour through opportunities for online discussion, collaborative projects, source checking, and structured peer review. Teachers can facilitate these opportunities by setting up good examples, clarifying expectations and giving feedback. However, the degree of behaviour change achieved by these practices needs to be investigated empirically. There's a new challenge with the rise of generative AI. Brainstorming, explaining and drafting can be facilitated by the use of AI tools, but the value of the AI tool is also a function of how the students use and evaluate its output. Institutions should thus be provided with clear guidance on AI acceptable assistance, disclosure requirements, verification of created information and independent contribution by the student. These concerns can be organized under the umbrella of the EDCE framework in the context of the broader conversation of digital citizenship.

Another implication is to do with assessment. The completion of assignments, platform engagement and examination outcomes are all significant measures of educational engagement, but none alone provide a definitive answer to whether students act ethically online. Teachers may then require opportunities to have students practice source evaluation, respectful communication and responsible decision making. Evaluation of such behaviours must be clear, fit the educational circumstances, and in compliance with student privacy. Instead it is a visionary proposition to seek to develop a common framework of ethics, involvement and reflection. Its utility will be contingent on the clarity of its concepts, their appropriateness in education and their being supported by further research.

Overall, the discussion reinforces the importance of not neglecting ethical and civic issues in digital education. But the statements in this paper are still theoretical. Further empirical research is required to investigate whether the use of educational activities based on EDCE leads to enhancement of ethical reasoning, impact on online behaviour and effectiveness in various learning contexts. The Internet is not the source of honesty, fairness and respect for others. But the objection vastly underestimates the influence the online environment can have on the conditions in which those values are tested. The anonymity, scale and speed of digital is not a “by product”. spaces; they are the basic elements that facilitate actions and direct temptations to act, and make them more difficult to avoid. catch, the old fashioned approach to teaching ethics (which is why it was hidden), is through sight. The old fashioned approach to teaching ethics is through sight, that's why it was hidden catch. consequential and social needs conscious digital counterpart, not being It is assumed that this will be automatically transferred to the student's personal device. Ethical digital art is the second implication that comes from the above discussion. instruction is not something which can be contained in the structure of one course or one week of orientation. Ethical issues in Digital contexts occur in an unpredictable manner, in a group project, In each class, there will be a research task, but there will additionally be a casual exchange on the Internet, the EDCE pillars work. The best use they can be made of is to be widely distributed across a curriculum rather than concentrated in one. A Individual required lectures, however great, will not suffice to attain a greater grasp on digital ethics. recalled at the moment that a pupil is considering whether to pass on an unverified claim. months later.

CONCLUSION

In a relatively brief period of time, digital learning has emerged as one of the defining characteristics of modern education changing the ways for students to seek the information, communicate, and participate in the environment in which they live. It has helped to make learning much more flexible and more broadly accessible is attainable, and these gains are genuine and worthy of being maintained. However, the same transition has resulted in the insertion of Ethical and social issues that were not faced by earlier education in the classroom. Have to compete with in a similar manner. This paper's key argument is that academic outcomes and technical ability are not enough. A "well educated student" is no longer a student who possesses the skills and knowledge of a single discipline. Ethical awareness, critical They must be accompanied by thinking and civic responsibility, as it is made a point of in education. Responsible for teaching, instead of values that are absorbed by osmosis.

The EDCE framework is grounded in Ethical Awareness, Responsible Participation. Integrated environments as opposed to "afterthought" environments. It has a fundamental purpose of easy to contribute to the creation of digital users who are deep and thoughtful enough in judgment to add a positive contribution to the communities they become a part of online. Finally, the goal of digital education should go beyond preparing students for the workplace and technological fluency. It should also help to develop an informed, empathetic individual, Sensitive to social issues and willing to employ responsibly the tools at their disposal for their own benefit. On behalf of and for the benefit of the community (online and offline) of which they are a part.

There's no need to distrust technology in these respects. Throughout this guide you will be learning about and using the tools outlined below. The origin of this paper is not AI systems, online platforms, digital classrooms. The lack of intentional ethics teaching with them is a problem. An institution that the digital skills without digital ethics approach is, in effect, giving students a powerful set of tools. and even at a considerable expense, letting them find the correct way to use those tools through trial and error. Money that is contributed by the other person. The EDCE framework is provided as a means to bridge that gap, but not as the only possible way, it is offered in the hope that it will be tested, challenged and changed. Refined and not taken for granted.

Suggestions for Future Research

The constraints mentioned above in this paper raise several directions for future research. Empirical testing of the EDCE framework designing and piloting an EDCE based module in a real classroom, then observing if it brings about observable change in students' ethical reasoning and online behaviour would cover the framework's uncurrent validation by empirical research. Comparing and contrasting digital ethical behaviour and civic engagement across various countries, as well as examining how they vary between rural and urban schools, government and private schools, or fully online and blended learning environments, may reveal the contextual factors that matter most. Continued usage of AI technologies should be monitored for its impact on independent thinking, specifically how AI tools influence students' creativity, originality, and decision making over time, preferably through longitudinal studies. The surrounding adults and communities, including teachers, parents, and online groups, significantly shape ethical behaviour; understanding how these influences interact with formal instruction is a promising direction for future work.

Since the literature suggests teachers themselves do not always feel confident teaching digital citizenship content, future research could gauge educator readiness and test whether targeted faculty training impacts classroom outcomes. Given that AI tools are relatively new, future work could also develop and test scenario based teaching materials addressing authorship, disclosure, and accountability directly areas the current literature covers only thinly. Taken together, these directions converge toward the same need moving the EDCE framework, and digital citizenship frameworks as a whole, from a conceptual proposal toward a tested, evidence backed practice that institutions can employ with confidence.
