ABSTRACT

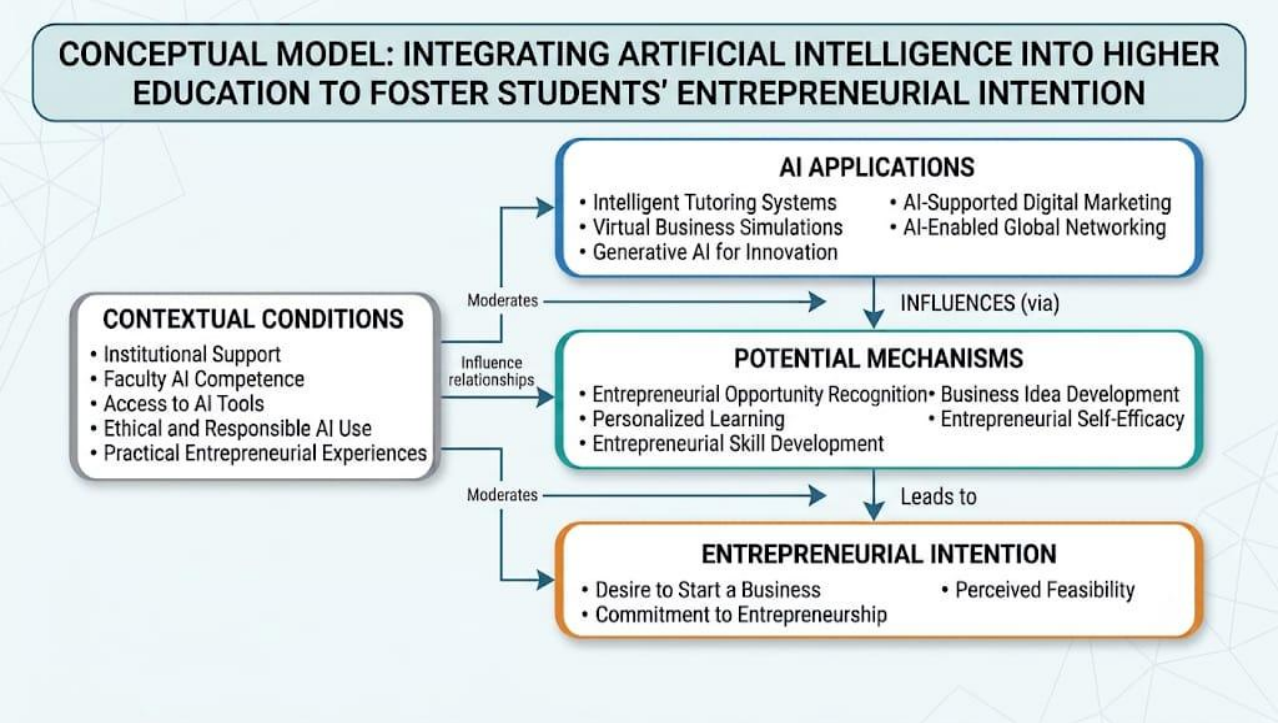
The rapid advancement of artificial intelligence is transforming higher education by reshaping teaching, learning and entrepreneurial skills development, Beyond improving academic performance, artificial intelligence offers significant opportunities to foster entrepreneurial intention by equipping students with the knowledge, skills and confidence required to identify business opportunities, solve complex problems and develop innovative business ideas. The main objective of the study is to examine how the integration of artificial intelligence can foster entrepreneurial intention among students. The present study adopts a conceptual review approach to examine the potential relationship between the integration of artificial intelligence in to higher education and students' entrepreneurial intention. The study focus on higher education scenario. The study highlights that the integration of artificial intelligence in to higher education will foster entrepreneurial intention among students by personalized learning, intelligent tutoring systems, virtual simulations and generative artificial intelligence applications, can strengthen entrepreneurial competencies. Artificial intelligence supported learning environments are expected to prepare students to pursue entrepreneurial careers, adapt to the evolving demands of the digital economy and contribute to sustainable economic and social development.

Keywords: Entrepreneurial intention, Artificial intelligence, Higher education, Digital competence, Innovation

INTRODUCTION

The emergence of artificial intelligence has dramatically changed every aspect of society such as education, business, finance, innovation and industry. Artificial intelligence is increasingly used in higher education to support teaching, learning, feedback, information analysis and the development of digital capabilities. Entrepreneurial intention refers to an individual's readiness or willingness to pursue entrepreneurial behaviour (Ajzen, 1991). It is influenced by several personal, social and contextual factors. Ajzen's theory of planned behaviour explains entrepreneurial intention through attitudes towards the bahaviour, subjective norms and perceived bahavioural control. Similarly, shapero and sokol's (1982) entrepreneurial event model highlights perceived desirability, perceived feasibility and the tendency to act. These perspectives suggest that students' entrepreneurial intentions depend not only on access to information but also on their perceptions, confidence, motivation and surrounding environments. Higher education plays an important role in preparing students for employment, professional development and entrepreneurial opportunities. However, obtaining a degree does not necessarily ensure that students possess the competence, confidence and practical knowledge required to establish a business. In entrepreneurial education, AI tools can help students to generate and refine business ideas, explore market information, develop business models and practice decision making in simulated settings. These applications may create additional opportunities for students to connect academic knowledge with entrepreneurial tasks. Al supported entrepreneurial education may contribute to these factors through different learning mechanisms such as opportunity recognition, perceived feasibility, entrepreneurial self efficacy and practical learning. AI applications do not guarantee

stronger entrepreneurial intention. Students may gain skills or produce ideas without deciding to start a business. The effect may depend on the quality of the learning design, the role of teachers, students' ability to evaluate AI generated output and the institutional environment.



The central problem addressed by this study is whether AI can be used in higher education, and how AI supported learning may relate to entrepreneurial intention and under what conditions this relationship may be stronger or weaker. A conceptual explanation needs to distinguish the AI applications themselves from the learning mechanisms through which they may operate and from the conditions that influence their use. The review is guided by the following research gap, the literature addresses AI literacy, AI supported entrepreneurial education and entrepreneurial outcomes, but these strands need to be brought together in a framework that distinguishes AI applications, potential intention forming mechanisms and contextual conditions. The purpose of this conceptual review is to develop a framework for explaining how AI integration in higher education may contribute to students' entrepreneurial intention. It addresses four questions "what AI applications are discussed in relation to entrepreneurial learning in higher education?" "what potential and psychological mechanisms might these applications relate to students' entrepreneurial intentions?" " what institutional and individual conditions may strengthen or weaken these relationships"? " how can these relationships be organised in to a conceptual framework for future research"? The proposed framework may also help educators and higher education institutions to identify the learning experience, institutional support, and individual capabilities that need consideration when integrating AI in to entrepreneurial education. A Conceptual framework is presented to distinguish AI application, potential mechanisms, contextual conditions and entrepreneurial intention as an outcome. AI based business simulations may help students to understand entrepreneurial challenges and access their ability to manage them. Generative AI tool may support idea generation while AI assisted market analysis may help students to recognise potential business opportunities. Personalized learning systems may also address differences in students' learning needs and entrepreneurial interests. However, the availability of these technologies does not necessarily ensure that students will develop stronger entrepreneurial intentions. Their influence may depend on how AI is integrated in to teaching, the quality of learning experiences, students' digital and entrepreneurial competencies and the support provided by the higher education institutions. Based on this conceptual model, the integration of artificial intelligence in to higher education acts as a key driver in shaping students' entrepreneurial intentions. Diverse AI applications, including intelligent tutoring systems, virtual business simulations and generative AI tools directly influence critical mechanisms like opportunity recognition, skill development and entrepreneurial self efficacy. Contextual conditions such as institutional support , faculty competence and ethical AI usage serve as vital moderators that shape these pathways. This

framework highlights how leveraging AI in academic environments effectively enhances students' desire, commitment and perceived feasibility to pursue entrepreneurship.

REVIEW OF RELATED LITERATURE

Duong (2026) conducted a study on Artificial Intelligence Literacy and Higher Education Students' Digital Entrepreneurial Intention: A Moderated Mediation Model of AI Self Efficacy and Digital Entrepreneurial Self Efficacy. This study examined the influence of AI literacy on digital entrepreneurial intention and to investigate the mediating role of digital entrepreneurial self-efficacy and the moderating role of AI self-efficacy. This study adopted survey method. The sample consisted of university students from Vietnam. The findings revealed that AI literacy significantly and positively influence students' digital entrepreneurial intention and the digital entrepreneurial self-efficacy mediates this relationship while AI self-efficacy further strengthens it's positive effect.

Adelakun (2026) explored a study on Integrating Artificial Intelligence in to Entrepreneurship Education for Emerging Graduates in Nigeria. This study examined the role of artificial intelligence in enhancing entrepreneurial competencies among engineering graduates in Nigeria. This study adopted descriptive review approach. The study focus on engineering graduates. The findings revealed that integrating AI in to entrepreneurial education significantly improves innovation, entrepreneurial thinking and business readiness among engineering graduates.

Awad et al. (2025) conducted a study on Integrating Artificial Intelligence in Entrepreneurship Education: A Study of Higher Education Institutions in the Middle East. This study examined the influence of the Gen AI chatbot(chat GPT) and the AI based simulation platform on students' startup intention. This study adopted a survey method. The sample consisted of undergraduate business administration students from four higher education institutions in the Middle East. This study found that AI tools positively influence students' entrepreneurial intention.

Tang et al. (2025) studied the Role of AI and Entrepreneurial Ecosystem in Shaping Students' Digital Entrepreneurship Intentions: Evidence from a Multi Group Analysis. This study aimed to examine how artificial intelligence and the entrepreneurial ecosystem influence students' digital entrepreneurial intentions. The study adopted survey method. The sample consisted of higher education students. The findings indicated that AI significantly enhances students' digital entrepreneurial intentions by improving digital capabilities and entrepreneurial readiness.

While collecting reviews, the investigator included the studies directly addressed the integration of artificial intelligence in to higher education, AI supported entrepreneurial education and factors related to students' entrepreneurial intention. Eligible publications examined the use of AI in teaching, learning, assessment and educational support within entrepreneurial education and contributed to understanding the potential mechanisms linking AI supported learning with entrepreneurial intention. The selected literature was examined thematically to identify key concepts, potential relationships and the conditions under which AI integration may contribute to students' entrepreneurial intention. The review Priority was given to recent literature published in 2025 and 2026 to reflect contemporary developments in the integration of AI in to higher education and entrepreneurial learning.

Need and Significance of the Study

The need for this study arises from the rapid advancement of artificial intelligence transforming the global economy, business environment and the labour market. Consequently higher education institutions are expected to equip students with entrepreneurial competencies, digital intelligence, innovation and higher order thinking skills required to in an increasingly technology driven world. Without these competencies, graduates may struggle to remain competitive, adapt to technological disruptions and sustain themselves in the evolving labour market. Artificial intelligence has become an integral part of modern business by enhancing innovation, improving productivity, supporting data driven decision making and creating

competitive advantage. It provides accessible and intelligent tools that enable aspiring entrepreneurs to identify opportunities, develop innovative business ideas, evaluate business feasibility and transform entrepreneurial concepts in to viable ventures with greater confidence and efficiency. Therefore, exposure to AI supported entrepreneurial learning has become essential for preparing students for the demands of the digital economy. In higher education, AI offers significant opportunities to personalize learning, foster creativity, strengthen entrepreneurial knowledge, enhance digital literacy and promote innovation. When students used as supportive educational tool, AI can facilitate advanced thinking, problem solving, critical analysis and opportunity recognition without replacing students' creativity or independent thinking. The effective integration of AI should empower learners to think more deeply, make informed entrepreneurial decisions and develop sustainable entrepreneurial competencies. Therefore, the present study is needed to explore how AI can be effectively integrated in to higher education as a supportive educational resources to enhance entrepreneurial intention, entrepreneurial competencies and digital readiness while preserving students 'creativity, critical thinking and independent thinking.

Objective of the Study

To examine how the integration of artificial intelligence can foster entrepreneurial intention among higher education students.

Methodology Selected for the Study

The present study adopts a conceptual review approach to examine the potential relationship between the integration of artificial intelligence in to higher education and students' entrepreneurial intention. Relevant literature was identified through scholarly database, including google scholar. The search focused on research articles, review papers and theoretical publications related to artificial intelligence in higher education, entrepreneurial education, AI supported entrepreneurial learning and entrepreneurial intention.

Analysis and Interpretation of the Study

The theoretical literature and review analysis identified the following key points that explain how the integration of artificial intelligence can foster entrepreneurial intention among students:

- AI Enabled Intelligent Tutoring Systems

AI enabled intelligent tutoring systems provide personalized guidance, adaptive learning experiences and real time feedback designed to meet students' diverse learning needs. These systems enable students to develop entrepreneurial knowledge, strengthen critical thinking, enhance creativity, improving problem solving abilities and build the confidence required for venture creation. The AI enabled tutoring systems provide continuous support by identifying emerging business opportunities, offering valuable insights and facilitating access to practical entrepreneurial resources. These support helps prepare students to meet the dynamic demands of the digital economy.

- AI Based Virtual Business Simulations

AI based virtual business simulations enable students to engage in realistic entrepreneurial activities within a virtual environment that replicates real world business operations. These simulation platforms allow learners to establish and manage virtual enterprises, develop business plans, ,analyse market trends, interact with virtual customers and competitors and make strategic business decisions in a risk free environment. These virtual environments encourage students to collaborate with peers, evaluate the outcomes of their decisions and refine their business strategies through continuous feedback and reflection.

- AI Supported Entrepreneurial Personalized Learning

AI supported technologies facilitate entrepreneurial personalized and self-directed learning by adapting educational content to students' individual needs, interests learning goals and entrepreneurial aspirations.AI

enables students to continuously update their knowledge, acquire relevant entrepreneurial skills and stay informed about emerging business trends and technological innovations. This personalized learning enhance students' entrepreneurial confidence and readiness to pursue entrepreneurial careers.

- Entrepreneurial Opportunity Recognition Through AI

Artificial intelligence empowers students to recognize entrepreneurial opportunities by transforming large volumes of market data in to meaningful business insights. It is a powerful tool for discovering and evaluating entrepreneurial opportunities by providing access to real time market intelligence and predictive insights. As a result, students develop stronger entrepreneurial awareness, confidence and opportunity recognition skills. AI also help learners in evaluating the feasibility, profitability and sustainability of business ideas by providing real time insights and data driven recommendations.

- Institutional Transformation Through AI

Artificial intelligence is transforming educational institutions by reshaping teaching ,learning and entrepreneurial education. AI encourages educational institutions to redesign entrepreneurial curricula, strengthen industry collaborations, adopt digital pedagogies and promote innovation ecosystems. Such institutional transformation creates a supportive environment for nurturing entrepreneurial talent.

- Generative AI Applications for Innovation

Generative AI applications stimulate innovation by enabling students to generate creative business ideas, design innovative products and services, and develop sustainable business models. These applications helps learners to create innovative concepts, responding to evolving market needs and convert original ideas in to feasible entrepreneurial ventures.

- Digital Marketing Skills Through AI

Artificial intelligence significantly enhances students' digital marketing skills by enabling them to design,implement and optimize data driven marketing strategies. AI enhance students' digital marketing capabilities through market segmentation,customer profiling,social media management and personalized advertising. These AI driven marketing skills help students to understand customer behaviour,improve customer engagement and promote product and service more effectively. Consequently AI strengthens entrepreneurial competitiveness by enabling students to build successful business in digital markets.

- Global Networking through AI

AI expands students'global networking opportunities by connecting them with entrepreneurs, mentors, investors and professionals across the world. These global connections provide access to diverse knowledge, market insights,funding opportunities and international events and based on students interest and professional goals. This personalized approach enables students to build diverse and valuable networks that extent beyond institutional and geographical boundaries. It also supports participation in global webinars,innovation challenges, start-up incubators and online entrepreneurial communities, allowing students to exchange ideas,gain expert feedback and collaborate on innovative ventures with peers from different cultural and disciplinary backgrounds.

Major Findings

The analysis indicates that the integration of artificial intelligence in to higher education has significant potential to foster students 'entrepreneurial intention by creating intelligent, personalized, experiential and innovation driven learning environments. The analysis highlights that AI powered applications enhance entrepreneurial learning through intelligent tutoring systems, virtual business simulations, generative AI applications, personalized entrepreneurial learning and AI startup readiness bridge the gap between academic learning and entrepreneurial practice. These technologies empower students to transform

innovative ideas in to viable entrepreneurial ventures while developing the confidence and adaptability required in rapidly evolving digital economy. The meaningful integration of AI strengthen entrepreneurial knowledge, skills, confidence, adaptability and digital competencies required to identify and pursue entrepreneurial opportunities . Therefore, the effective integration of AI in to higher education can play a transformative role in preparing future entrepreneurs capable of succeeding in the dynamic, technology driven global economy. AI powered learning environments bridge the gap between theoretical knowledge and entrepreneurial practice through intelligent tutoring systems, virtual business simulations, generative AI applications and personalized learning experiences and data driven insights. These technologies encourage continuous learning, collaboration and innovation, enabling students to transform creative ideas in to viable and sustainable entrepreneurial ventures. AI serves as a catalyst for entrepreneurial education by cultivating future ready competencies, an entrepreneurial mind-set and a commitment to lifelong learning. Therefore, the effective integration of artificial intelligence in to higher education can play a pivotal role in nurturing innovative, resilient and socially responsible entrepreneurs who are capable of driving sustainable economic growth and creating value in an increasingly AI driven global society.

Educational Implications and Suggestions

Artificial intelligence should be integrated in to teaching and learning practices to create personalized,interactive and learner centred educational experiences that strengthen students' entrepreneurial intention. Curriculum designers should incorporate AI enabled entrepreneurial activities such as business simulations,virtual start-up,predictive analytics and real world problem solving tasks to promote entrepreneurial learning. These activities bridge the gap between theoretical knowledge and practical application. Teacher educators and faculty members should receive continuous professional development to effectively use AI tools for mentoring students and fostering innovation. Institutions should also establish AI supported innovation labs,entrepreneurial incubation centres and industry collaborations that provide students with opportunities to identify business ideas,develop entrepreneurial competencies and gain practical experiences. Higher education policies should emphasize the ethical and responsible use of AI while promoting creativity,critical thinking and opportunity recognition , ensuring that graduates are well prepared for entrepreneurial careers in the rapidly evolving digital economy. Higher education institutions should develop AI enabled entrepreneurial ecosystems that encourage innovation, collaboration and experiential learning. Such ecosystems can empower students to become opportunity creators,innovative problem solvers and socially responsible entrepreneurs capable of meeting the evolving demands of the digital economy.

CONCLUSION

The present study concludes that the integration of artificial intelligence in to higher education provides a transformative approach for fostering students 'entrepreneurial intention. By creating intelligent, personalized, and experiential and innovation driven learning environments,AI enhances entrepreneurial learning and prepares students to meet the demands of the rapidly evolving digital economy.The integration of AI enables learners to develop creativity, opportunity recognition, critical thinking, innovation, problem solving, informed decision making, digital competence and entrepreneurial readiness, thereby strengthening their ability to identify, evaluate and pursue entrepreneurial opportunities.
